INTRODUCTION TO PYTHON

HISTORY OVERVIEW

CHRONOLOGICAL DEVELOPMENT

Python was created by Guido van Rossum and first released in 1991. It was designed to emphasize code readability and simplicity. Over the years, language features and syntax have evolved, leading to new versions. The introduction of Python 2.0 and later Python 3.0 marked key shifts in the language's functionality and usability.

CORE FUNCTIONS

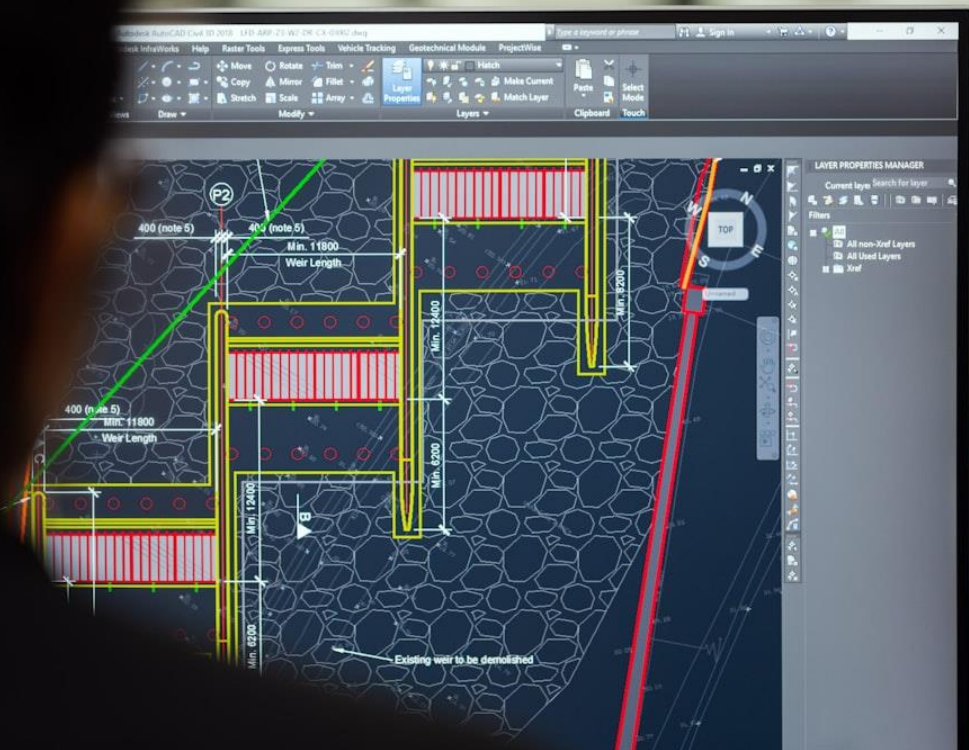

CONTROL STRUCTURES

Control structures such as loops and conditionals govern the flow of execution in Python. They include 'if', 'for', and 'while' statements which enhance code flexibility. Mastering control structures enables more complex program functionalities. Implementing these structures is essential for problem-solving in programming.

BASIC DATA TYPES

Python supports various data types including integers, floats, strings, and booleans. This versatility allows developers to handle different kinds of data efficiently. Understanding these core types is critical for programming tasks. Each data type has unique methods and operations that can be utilized in code.

IMPORTANCE OF MODULES

a പൂർണ്ണമായി ഉൾക്കൊള്ളുന്ന ഒരു തൂങ്ങിയ പിന്തിരിയ്ക്കൽ ക്രമം
 ടിട്രാഹിഡ്രൽ തൂങ്ങൽ ക്രമം നൽകുന്ന പിന്തിരിയ്ക്കൽ ക്രമം
 മുൻപ്രകാരം എല്ലാ തൂങ്ങൽ ക്രമങ്ങളും തുല്യമാണ്. ഈ തൂങ്ങൽ ക്രമം
 തൂങ്ങൽ ക്രമം തുല്യമാണ്. ഈ തൂങ്ങൽ ക്രമം തുല്യമാണ്.

MODULES IN PYTHON

USING MODULES EFFECTIVELY

Python has a rich ecosystem of modules available through its Standard Library. Importing modules is straightforward, allowing for quick integration of various functionalities. Additionally, third-party modules can be installed using package managers like pip, extending Python's capabilities. This flexibility makes Python an essential tool for development.

HISTORICAL MILESTONES

| YEAR | MILESTONE | DESCRIPTION |
|------|--------------------------|---|
| 1991 | First Release | Official release of Python 1.0. |
| 2000 | Python 2.0 | Introduction of list comprehensions and garbage collection. |
| 2008 | Python 3.0 | Major redesign of the language that emphasized removing redundant features. |
| 2020 | End of Life for Python 2 | Discontinuation of support for Python 2.x versions. |

FUNCTION USAGE STATISTICS

STRING FUNCTIONS

String functions are used in 50% of Python programs due to the importance of text manipulation across applications. They handle tasks such as formatting and searching strings efficiently.

FILE HANDLING FUNCTIONS

File handling functions comprise 15% of usage statistics. They enable reading from and writing to files, which is crucial for data persistence in programs.

DICTIONARY FUNCTIONS

Dictionary functions are utilized in about 5% of cases, showing the specific needs for key-value pair storage in Python applications. They are essential for certain data structures.

LIST FUNCTIONS

List functions account for 30% of usage, highlighting their role in managing collections of data. Lists are vital in data processing and manipulation tasks.

FUTURE OF PYTHON

FUTURE DEVELOPMENTS

The future of Python looks promising with ongoing enhancements focusing on performance and ease of use. New libraries and frameworks are emerging, catering to areas like artificial intelligence and data science. Community support continues to grow, fostering innovation and collaboration among developers. As Python evolves, its applicability across various domains is expanding significantly.

FUNCTION AND MODULES BASICS

KEY FUNCTION CONCEPTS

FUNCTION SCOPE & LIFESPAN

Each function has a specific scope and lifespan, determining where its variables can be accessed. Local variables exist only within the function, while global variables can be accessed anywhere in the code. Understanding this distinction prevents variable conflicts and promotes better resource management.

DEFINITION OF FUNCTIONS

Functions are reusable blocks of code that perform a specific task. They help in organizing code, making programs easier to understand and manage. Functions can take inputs, known as arguments, and return outputs. Mastering function definitions is essential to writing efficient code.

MODULES OVERVIEW

| MODULE TYPE | DESCRIPTION | EXAMPLES |
|----------------------|--|-------------------------------------|
| Standard Libraries | Built-in modules providing core functionality. | math, datetime, sys |
| External Libraries | Additional modules created by the community. | NumPy, Pandas, Requests |
| User-Defined Modules | Custom modules created by developers. | Custom functions saved in .py files |
